PRODUCT OVERVIEW

Mini-Circuits' RC-1SPDT-A18 is an independently controlled, electro mechanical SPDT switch. It operates over an extremely wide bandwidth, from DC to 18 GHz with high isolation and low insertion loss. The absorptive switch is of a failsafe and break before make configuration, with a lifetime of 5 million switching cycles per switch when used within the noted specifications.

The switch box is constructed in a compact, rugged metal case (4.5 x 6.0 x 2.25") with all SMA (f) RF connectors on the front panel. The switches are controlled via USB or Ethernet, allowing control directly from a PC, or remotely over a network. Full software support is provided, including our user friendly GUI application for Windows and a full API with programming instructions for Windows and Linux environments (both 32 bit and 64 bit systems).

KEY FEATURES

Feature	Advantages
Mechanical SPDT Switch	Mechanical absorptive switches provide high reliability, repeatable high performance and internal termination of input signals on the disconnected paths
High power operation from DC to 18 GHz	Supports a wide range of RF test and signal routing applications up to X and Ku bands, with 40W input power.
Break-before make configuration	Prevents a momentary connection of the old and new signal paths, reducing the inconsistent transient effects that could otherwise be observed during switching
USB & Ethernet control	USB HID and Ethernet (HTTP / Telnet) interfaces provide easy compatibility with a wide range of software setups and programming environments
Full software support	User friendly Windows GUI (graphical user interface) allows manual control straight out of the box, while the comprehensive API (application programming interface) with examples and instructions allows easy automation in most programming environments

TYPICAL SWITCHING PERFORMANCE

The graphs below present the typical mechanical switching characteristic from the point of applying the internal DC voltage to the switch actuator (identified by the purple "trigger" trace). USB / Ethernet communication delays are excluded (in the order of several ms , depending on PC / network performance). The break before make process is visible in the sequence of events (the active switch path is disconnected, prior to connecting the final switch path).
